

PROTEC III LSF CHEM RX

FOR PREVENTION OF SHALING AND DETERIORATING CONCRETE SURFACES

Protec III LSF Chem RX is critical for sound, strong concrete surfaces. Protec III LSF Chem RX works as a curing aid, allowing the concrete to properly cure, making a better stronger concrete surface. In addition to this, the liquid silica fume technology in Protec III adds a vital secondary process that chemically strengthens and hardens the wear surface. By doing this, additional strong concrete bonds are produced that make the concrete even more resistant to shaling.

Curing, hardening and strengthening the wear surface are critically important factors especially in today's world. Concrete additives are being used at an all time high by the industry and the contractors are being pushed to get things done faster, this makes it difficult to have concrete quality like they had 20 or 30 years ago.

This is why Cornerstone Coatings developed Protec III LSF Chem Rx. It is not something new that we hope will work, it has a proven track record in the industry for over 10 years.

Here's what long established contractors have to say about Protec III LSF Chem RX:

LG Concrete - Saskatoon, SK (Places and Finishes over 300 Driveways a Year)

"Protec III Chem RX is a really good product, it gives me peace of mind. I have no problems with my driveways. Protec III slows down the cure and increases the psi, and I don't have to worry about peeling.

Isaac Hiebert Warehouse Manager GrandWest Enterprises Inc

"We will definitely look at using Protec III LSF Chem RX again on our next expansion. Protec III Chem-RX LSF has absolutely no maintenance to the finish, only periodic sweeping to keep it clean. The floor no longer dusts, the product makes the concrete reflect light extremely well, and it is easy to keep clean."

Michele Cruise-Pratchler, R.M.A. Administrator

"Our sidewalks were poured in 1999 and due to a number of factors, had rapidly deteriorated. The application of Protec III LSF Chem RX has been very successful in halting any further deterioration of the sidewalks. Since this sealant has been applied, the condition of the sidewalks have not gotten any worse, even following the winter months during which a significant amount of ice melting products were required to be applied due to freezing rain and other environmental conditions that caused extremely icy conditions. We are very pleased with the results of Protec III LSF Chem RX. The investment in the application of this sealant has proven to save us a great expense that would have incurred had the sidewalks continued to deteriorate and required replacement."

Harold's Concrete Saskatchewan (Poured and Placed over 1000 Driveways)

"I love this stuff, Protec III LSF Chem RX. We have no shale, pops or shrinkage cracks, not like we used to have with the curing compounds or cure and seals we used to use. It also give the concrete that blue-grey look when it is curing, like it is supposed to be."

With Protec III LSF Chem RX's proven track record of preventing shaling and deteriorating concrete surfaces - builders, contractors and the industry as a whole, are given peace of mind and renewed confidence in concrete placing and finishing. Cornerstone Coatings is proud to provide this product to the industry through its quality distributors.
